Abstract of CN1338751

A data protection method for hard disk of computer includes creating an open sector table to record all non-protection sectors, creating virtual disk table to record the protected residual space, creating map table for mapping the corite operation to the empty sectors in protected area, the index tables of virtual table and map table for managing them, and creating dynamic map table for recordingthe mapping relation of limited number of R/W operations. Its advantage is high access speed.
